

Future of the Ganil DAQ

Bruno RAINE

GANIL-Caen

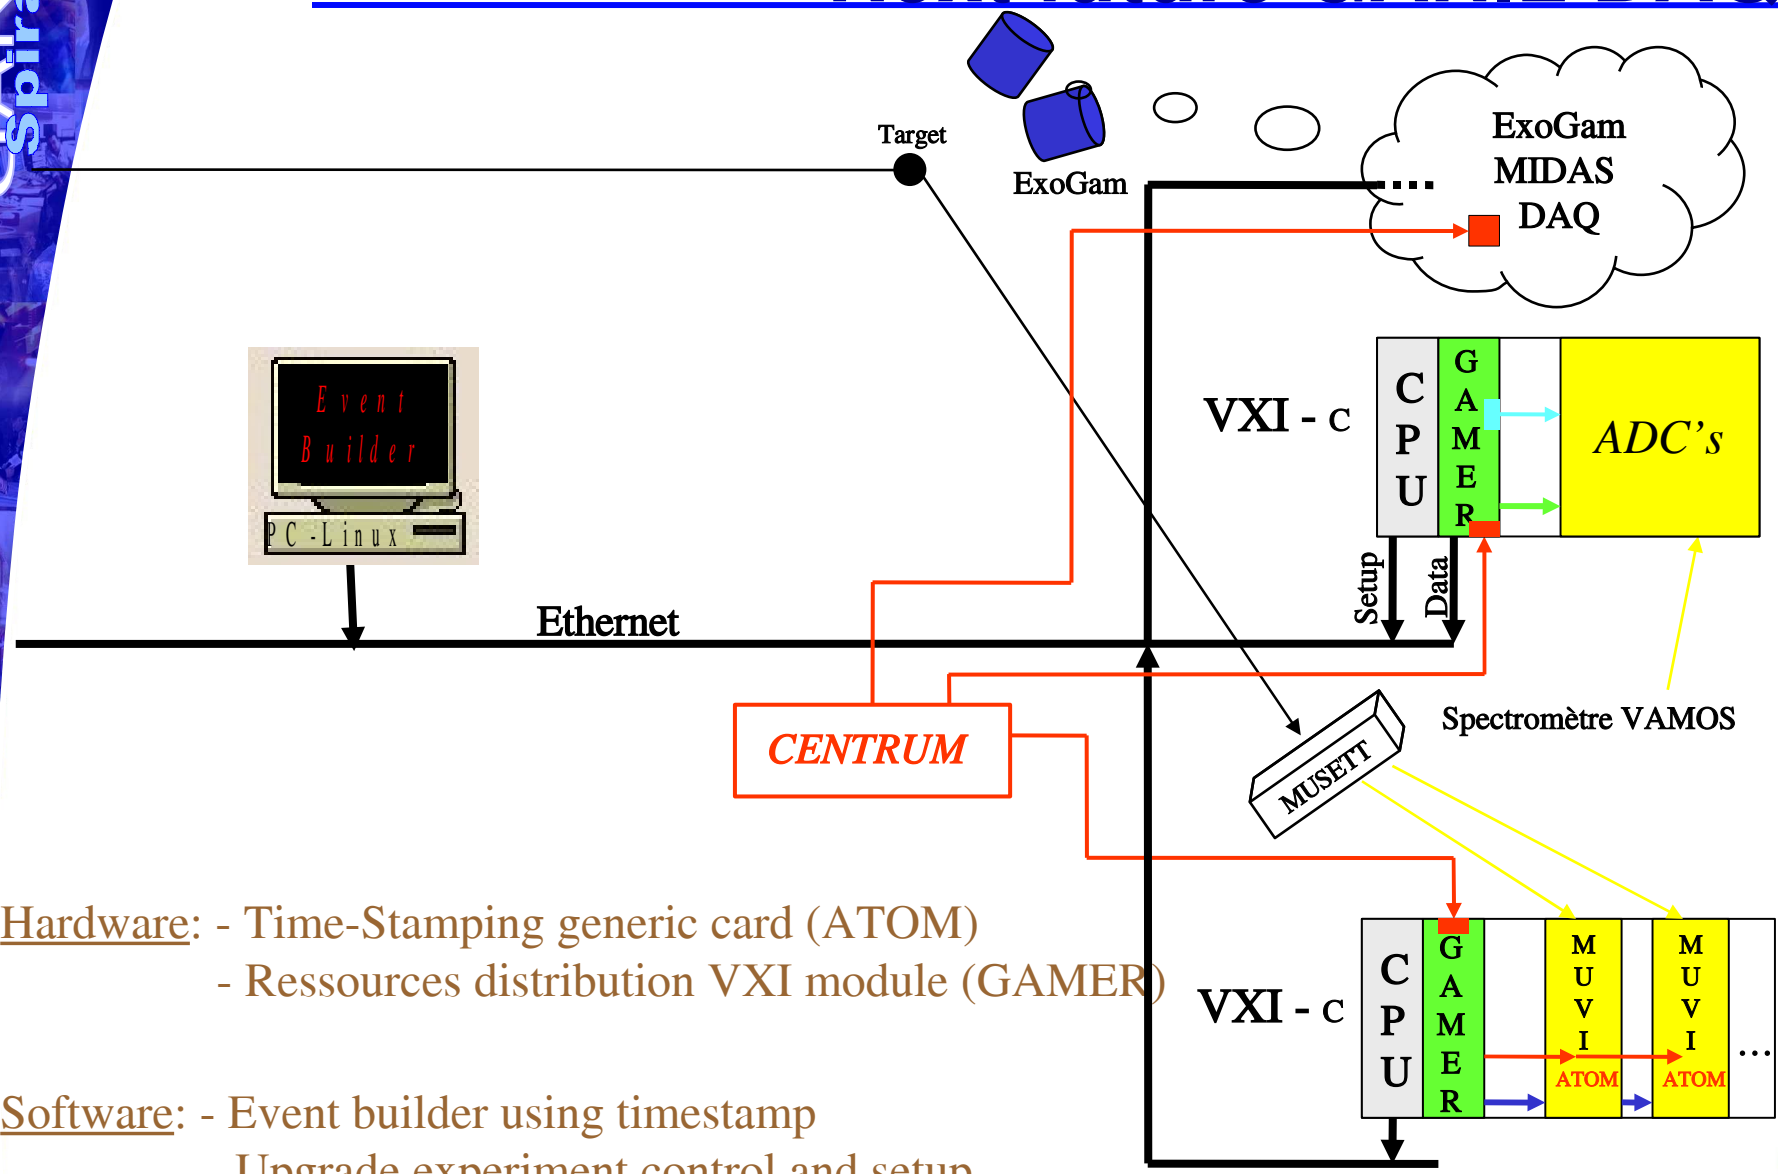

Future of the Ganil DAQ ?

Today GANIL DAQ

- Common dead time with event number distribution
- Independent setup for each subsystem
- Run control overall the system
- selection of active detector, start, stop, status, monitor data rate

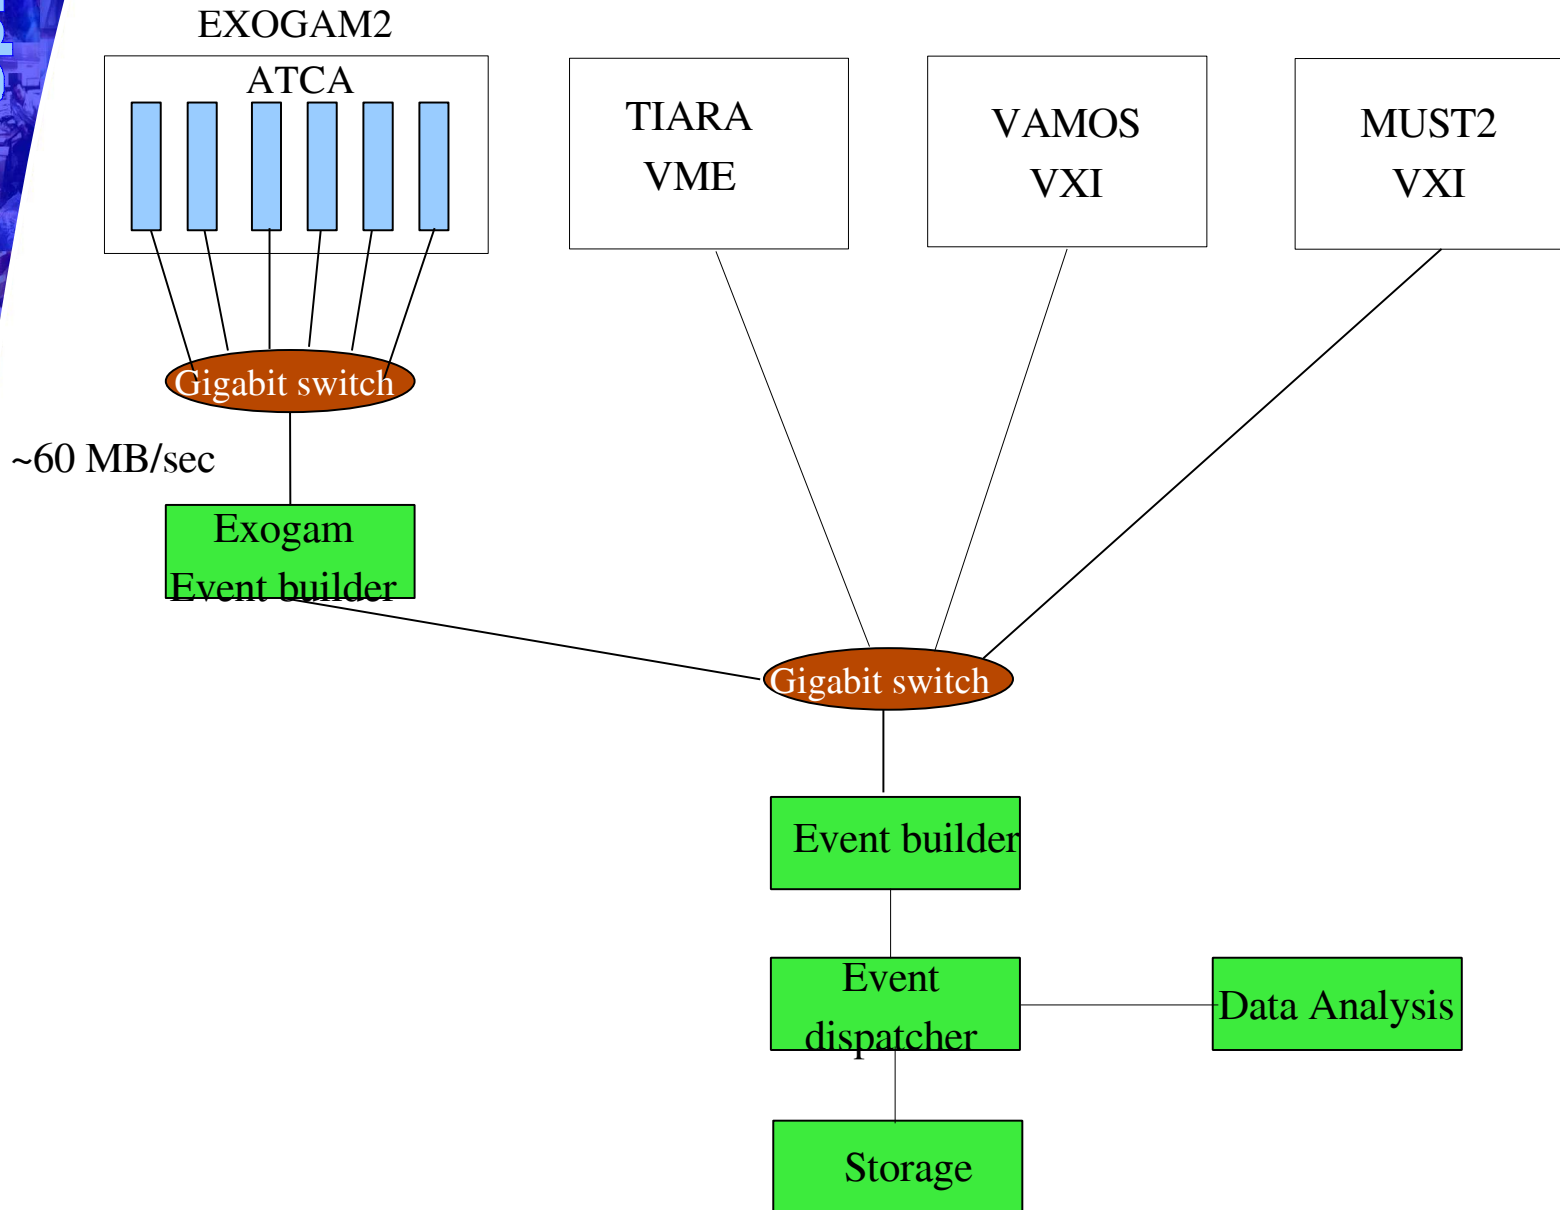

Next future GANIL DAQ

- Hardware:**
- Time-Stamping generic card (ATOM)
 - Ressources distribution VXI module (GAMER)

- Software:**
- Event builder using timestamp
 - Upgrade experiment control and setup

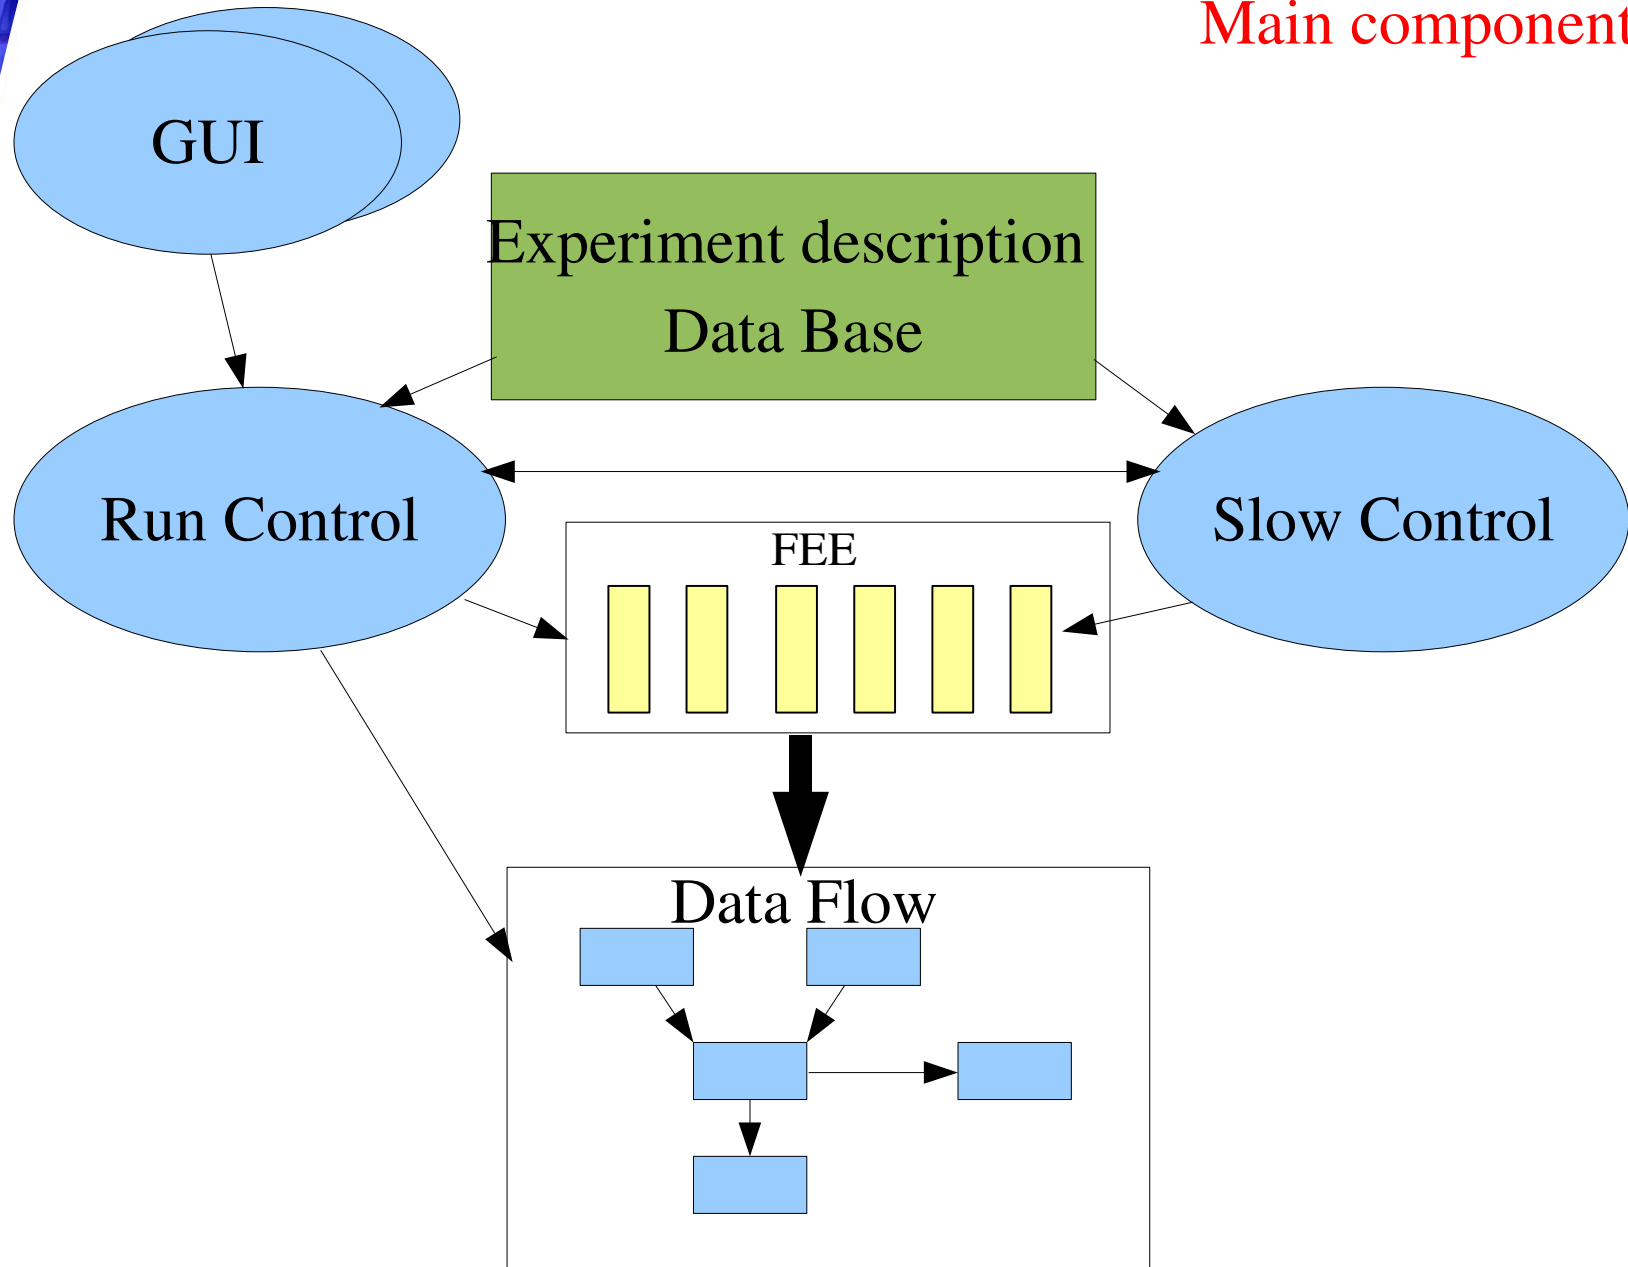

Future GANIL DAQ

■ Requirements

- ◆ small scale to large scale experiments
- ◆ connect any frontend
- ◆ trigger or triggerless systems
- ◆ process time stamp data stream
- ◆ highly modular acquisition system
- ◆ run control for all the components
- ◆ user friendly graphical interface

Main components

GANIL DAQ Development

- **Some principles**
 - ◆ **Client/server architecture for Core of applications (eg Run control, Slow control)**
 - ◆ **Configurations saved in XML**
 - ◆ **Communications : SOAP messages**
 - ◆ **Errors : Log4j, Log4C++, ...**

■ Main tasks

- ◆ Describe hardware configuration
- ◆ Save / restore hardware configurations
- ◆ Setup electronics
- ◆ Monitor electronics
- ◆ Handle errors and pass them to run control
- ◆ Accept commands from outside (eg Run Control)
- ◆ Several occurrences of GUI

■ Current GANIL slow control

- ◆ GUI well adapted to current configurations
- ◆ To be redefined to separate GUI from kernel
- ◆ Save format to be upgraded to use XML
- ◆ **Work to be evaluated**

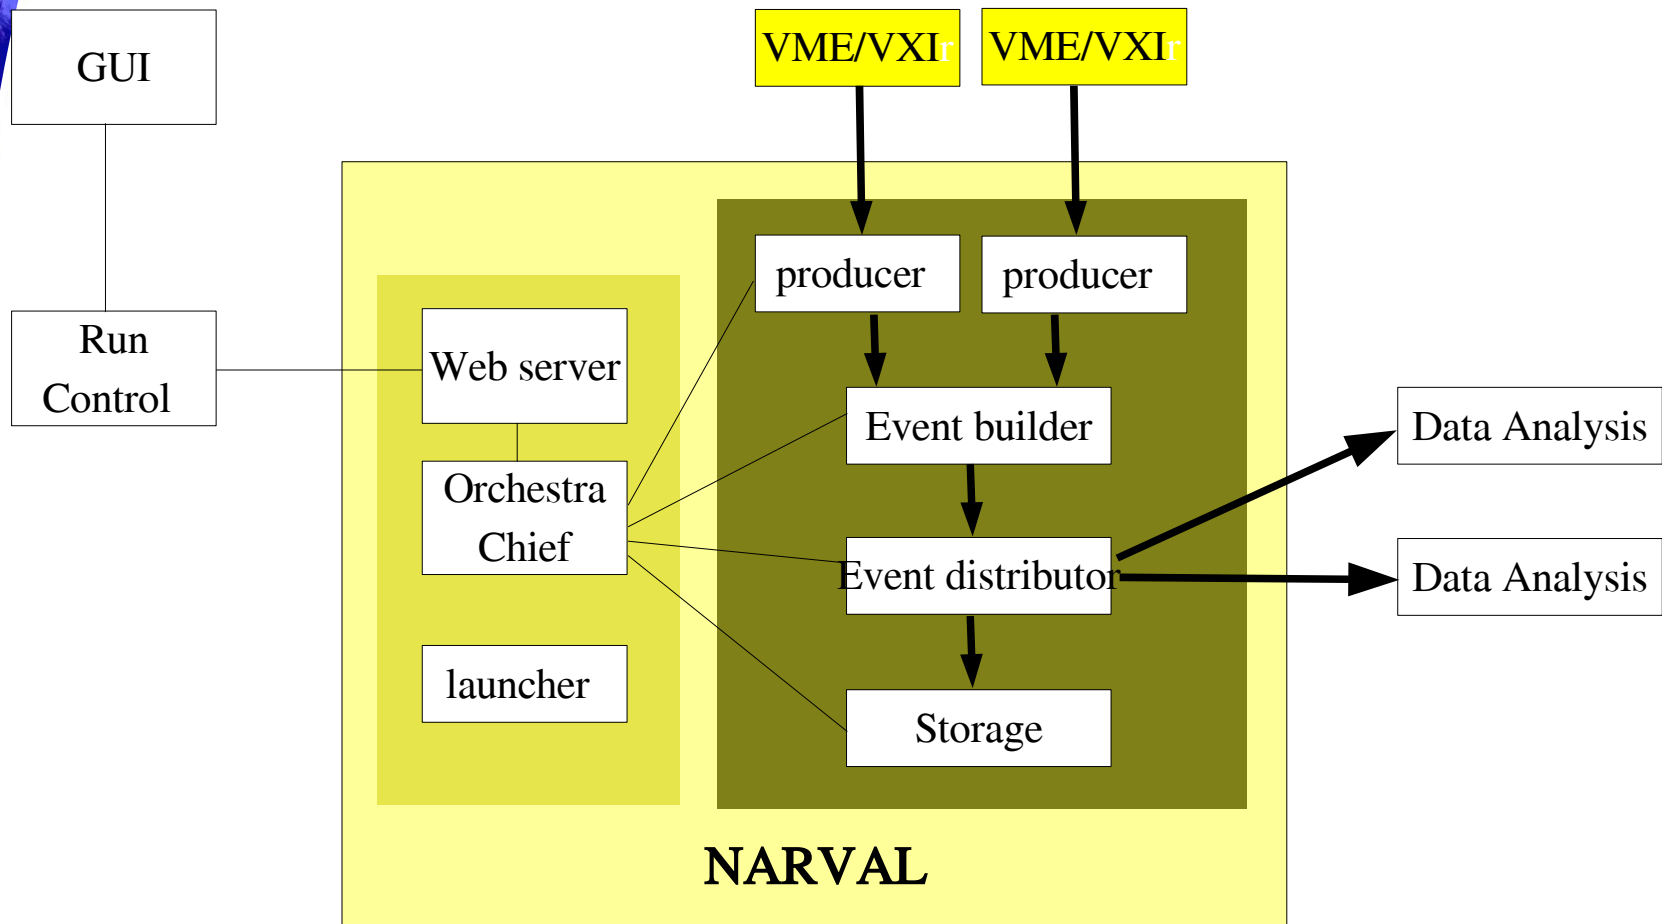

- **Main tasks**
 - ◆ **Configure DAQ for a run by selecting active components**
 - ◆ **Save/restore a configuration**
 - ◆ **Minimum set of commands to control all the components of the system (setup, start, stop...)**
 - ◆ **Monitor DAQ (status, data rate...)**
 - ◆ **Handle error messages**
 - ◆ **Log book**
 - ◆ **Scalable**
- **Needs a description of the architecture of the DAQ**
- **Development started**

■ NARVAL

- ◆ Developed by IPN Orsay and CSNSM
- ◆ Distributives Acquisition System
- ◆ Developed in Ada95
 - ◆ OO programming
 - ◆ Strongly typed language
 - ◆ Robust applications
 - ◆ Distributed processes by using Annex E (CORBA equivalent)
- ◆ Easy to link with C++
- ◆ Used for AGATA DAQ
- ◆ Collaboration with GANIL and LPC CAEN

- ◆ **Main components**
 - ◆ **A main process to handle all configuration state (« chef d'orchestre »)**
 - ◆ **Set of actors to manage dataflow**
 - **Producer (get data from hardware)**
 - **Intermediary (act as a NxM soft switch that can filter data)**
 - **Consumer (end of data flow that can store or transform data)**
 - ◆ **Error handler (Log4Ada)**
 - ◆ **Launcher**
- ◆ **Data flow transport over Unix fifo, TCP/IP, Infiniband**
- ◆ **Communication via Web Services (SOAP) with the « chef d'orchestre »**

Example of NARVAL in GANIL DAQ

■ General remarks

- ◆ Graphical user interface must be intuitive
- ◆ Some tools are needed to diagnostic and solve problems at every level
- ◆ Possibility to describe the system without having all the configuration on line
- ◆ System must be evolutionary
- ◆ It is difficult to create a new system without considering existing ones
- ◆ Support to users is very important in laboratories like GANIL. Local team needs to have a very good knowledge of the systems to be supported.
